

## How to grow tomatoes the easy way

Here's What You'll Need:

- potting soil or garden mix
- container or pot
- ripe tomatoes
- knife - parent to assist with the knife

Step 1 - Half fill your pot or container with potting soil.

Step 2 - Cut your tomato into 1/4 inch thick slices.

Step 3 - Place the tomato slices in a circle on the potting soil in your pot.

Step 4 - Take more soil and sprinkle a thin layer over your tomato slices. Do not cover them too high, so that they are just barely covered.

Step 5 - Gently water your pot, leaving it just moist but not too wet.

Your seeds should start to germinate within 7 to 14 days.

You can end up with upwards of fifty seedlings in your pot, which you can then pull out as they get stronger and replant in your garden or in another container.

Only plant a maximum of two seedlings per pot.

Notes:
